

## Your appointment:

**Date:** .....

**Time:** .....

**Location:**  
.....

Please see our website or the back of this form for more branch details

## Duration of Examination:

Musculoskeletal ultrasound examinations are normally 10-30 mins in duration. This may vary according to the reason for the examination.

## Please bring with you:

- Your request form
- All previous relevant imaging
- Medicare and any Healthcare cards

## Payment on the day of the examination is requested.

For more information on this procedure please call one of our branches.

# Musculoskeletal Ultrasound

## Patient Information Sheet No. US 5

### What is a Musculoskeletal Ultrasound scan?

Ultrasound is an effective tool for imaging soft tissue anatomy. It can be used to provide high resolution images of muscles, tendons and ligaments throughout the body. Ultrasound scans can be used to investigate sports and work-related injuries as well as causes of chronic musculoskeletal pain.

### What preparation is required?

No preparation is required.

### What will happen during the examination?

You may be asked to change into a gown and possibly remove jewellery depending on the area to be scanned.

The sonographer performing the examination may begin by taking a history of your complaint. Ultrasound gel will then be applied to the area of interest and an ultrasound transducer will be used to scan the relevant anatomy. For each body area there is a routine series of images that will be performed. There may be times when the sonographer scans where you are not tender to build up a complete understanding of your complaint and look for causes of referred pain.

When the sonographer has completed the scan they will discuss the imaging with the radiologist (specialist medical imaging doctor). In the majority of musculoskeletal ultrasound scans the radiologist will also come into the room to speak to you about your complaint. This is a routine practice and does not indicate that there is a serious problem.

### Are there any risks?

Ultrasound scans utilise high-frequency sound waves (mechanical vibrations) when producing images. No ionizing radiation is used. Ultrasound has been used in medicine since the 1950's and there have been no confirmed adverse effects attributed to diagnostic ultrasound exposure in this time. Benefits of the scan findings far outweigh any undiscovered risk.

### After the examination

The images will be reviewed and reported by our radiologist. This can take up to 90 minutes. For your convenience we can generally deliver the imaging and report to your doctor by the next working day. Alternatively your doctor may request that you wait or return later to collect the imaging and report

It is important you understand why and how we will be assisting you.  
If you have any questions, please call one of our branches or speak to our staff on the day of your visit.
